1 Patent claims

2

- 3 1. A switching device (1) having a first and a second
- arcing contact piece (2, 3), which lie axially opposite one
- 5 another, and a first and a second rated current contact
- 6 piece (5, 6), which are arranged coaxially with respect to
- 7 the arcing contact pieces (2, 3), at least one of the rated
- 8 current contact pieces (6) having a hollow-cylindrical basic
- 9 body (6a), which is covered at the front by an arc-resistant
- 10 material (9) at its end facing a switching path of the
- 11 switching device (1),
- 12 characterized in that
- 13 the arc-resistant material (9) has an electroplating.

14

- 15 2. The switching device (1) as claimed in claim 1,
- 16 characterized in that
- 17 the arc-resistant material (9) is fixed to the hollow-
- 18 cylindrical basic body (6a) in the form of a ring (9), so as
- 19 to cover front faces of the hollow-cylindrical basic body
- 20 (6a).

21

- 22 3. The switching device (1) as claimed in claim 2,
- 23 characterized in that
- the ring (9) has a smaller radial wall thickness at its end
- 25 facing away from the switching path than at its end facing
- 26 the switching path.

27

- 28 4. The switching device (1) as claimed in one of claims 2
- 29 to 3,
- 30 characterized in that
- 31 the ring (9) is pressed against the hollow-cylindrical basic
- 32 body (6a) of the rated current contact piece (6) in the
- 33 axial direction by means of a bolt connection (10).

- 1 5. The switching device (1) as claimed in one of claims 1
- 2 to 4,
- 3 characterized in that
- 4 the hollow-cylindrical basic body (6a) has a radial
- 5 projection (12), against which an insulating body (8), in
- 6 particular an insulating material nozzle, is pressed axially
- 7 by means of a pressure element (13).

8

- 9 6. The switching device (1) as claimed in claim 5,
- 10 characterized in that
- the hollow-cylindrical basic body (6a) has a reduced outer
- 12 diameter at its end facing the switching path, and in that
- 13 the radial projection (12) is arranged on the hollow-
- 14 cylinder inner casing in the region of the reduced outer
- 15 diameter.

16

- 17 7. The switching device (1) as claimed in one of claims 3
- 18 to 6,
- 19 characterized in that
- 20 the ring (9) has fixing devices in the region of its
- 21 enlarged radial wall thickness.

22

- 23 8. The switching device (1) as claimed in one of claims 1
- 24 to 7,
- 25 characterized in that
- 26 contact-making points between the two rated current contact
- 27 pieces (5, 6) lie axially in the region of the arc-resistant
- 28 material (9) in the switched-on state of the switching
- 29 device (1).
